EXP 8

Aim

To find the top 5 best-selling products using Pandas DataFrame operations.

Algorithm

1. Import Pandas.
2. Get product names and quantities as input.
3. Create a DataFrame and calculate total quantity for each product.
4. Display the top 5 products.

Code

Experiment 8 Code

```
import pandas as pd

p = input("Enter product names: ").split()
q = list(map(int, input("Enter quantities sold: ").split()))

df = pd.DataFrame({"Product": p, "Quantity": q})
print(df.groupby("Product")["Quantity"].sum().nlargest(5))
```

Input

Enter product names: Pen Book Pen Bag Book Pencil

Enter quantities sold: 10 20 15 5 12 8

OUTPUT:

```
================ RESTART: C:/Users/arunp/OneDrive/Documents/FDS/EXP 8.py =========
Enter product names: pen book pen bag book pencil
Enter quantities sold: 10 20 15 5 12 8
Top 5 best-selling products:
product_name
book      32
pen       25
pencil     8
bag        5
Name: quantity_sold, dtype: int64
```

Result

The top-selling products and their total quantities were successfully identified using Pandas.
