

Experiment 2: Average Product Price Using NumPy

Aim

To calculate the average price using a NumPy array.

Algorithm

1. Import NumPy.
2. Create a 2D array containing product prices.
3. Calculate the average using np.mean().
4. Display the average price.

Code

```
import numpy as np

sales_data = np.array([
    [100, 150, 200],
    [250, 300, 350],
    [400, 450, 500] ])

average_price = np.mean(sales_data)

print("Sales Data:")
print(sales_data)

print("Average Price:", average_price)
```

Input

Product price values: 100, 150, 200, 250, 300, 350, 400, 450, 500.

OUTPUT:

```
===== RESTART: C:/Users/arunp/OneDrive/Documents/FDS/EXP 2.py =====
Sales Data:
[[100 150 200]
 [250 300 350]
 [400 450 500]]
Average Price of All Products: 300.0
```

Result

The average of the given product price values was calculated as **300.0**.
