EXPERIMENT 15: Frequency Distribution of Likes on Social Media Posts

1. AIM

To write a Python program using Pandas to calculate the frequency distribution of likes received by social media posts.

2. ALGORITHM

1. Import the Pandas library.
2. Get the number of likes for each post as input from the user.
3. Convert the input values into integers.
4. Create a Pandas Series using the input data.
5. Calculate the frequency of each like count using value_counts().
6. Sort the frequency distribution in ascending order.
7. Display the result.

3. PYTHON CODE

Experiment 15 – Python Code

```
import pandas as pd

# Get input from the user
likes = list(map(int, input("Enter the number of likes for each post: ").split()))

# Create a Pandas Series
likes_series = pd.Series(likes)

# Calculate frequency distribution
frequency = likes_series.value_counts().sort_index()

# Display the result
print("\nFrequency Distribution of Likes:")
print(frequency)
```

4. INPUT

Enter the following values when you run the program:

Enter the number of likes for each post: 10 20 10 30 20 10

5. OUTPUT

```
========== RESTART: C:/Users/arunp/OneDrive/Documents/FDS/EXP 15.py =========
Enter the number of likes for each post: 10 20 10 30 20 10

Frequency Distribution of Likes:
10    3
20    2
30    1
Name: count, dtype: int64
```

6. RESULT

Thus, the Python program to calculate and display the frequency distribution of likes received by social media posts using Pandas was executed successfully.
